
Civic Connect — 10-Minute Hackathon Demo Video Script

(Team of 3, cameras on, one screen shared)

[0:00–0:20] Intro Scene

Screen: Civic Connect banner or landing page.

All on camera (smiling).

Puranjay (Lead intro):

“Hi everyone! We’re Team Code Crafters, and today we’re really excited to present our project — **Civic Connect: Bridging Citizens and City Services with AI.**”

(Pause 1 sec)

“We built this during the hackathon to solve a common civic problem — citizens often report local issues, but it’s hard to track progress or connect directly with their city departments.”

Teammate 2:

“Our goal was simple: make civic communication transparent, efficient, and intelligent using AI.”

Teammate 3:

“And we’re proud to share that Civic Connect is fully functional, live, and built using Google’s Gemini API to power smart features like automated department routing and chat-based updates.”

Part 1 — Project Overview (1:00–3:00)

Speaker: Puranjay

Screen: Landing page → Citizen issue reporting page → Dashboard preview

Puranjay:

“Let me start with a quick walkthrough of what Civic Connect does.”

(Screen: scroll slowly through homepage and main menu)

“It’s a **web-based platform** that empowers citizens to report civic issues — like potholes, power cuts, or water leaks — directly to their local government. Users can add a **title, description, upload a photo**, and their **exact location.**”

(Pause for 2 seconds while scrolling)

“As soon as the issue is submitted, **Gemini automatically analyzes it** and suggests the most relevant department — like Roads, Electrical, or Sanitation. This saves time and ensures reports reach the right people fast.”

(Screen: show department suggestion in action)

“There’s also our AI chatbot who can answer user queries or provide real-time updates on issue statuses. So, if someone wants to know whether their pothole has been fixed, Casey will instantly tell them the current status.”

(Screen: open chatbot briefly, show example query)

“Finally, we have a **public transparency dashboard** that visualizes metrics like department performance, total resolved issues, and even a leaderboard for top citizen contributors. It’s all about building trust and accountability.”

(Screen: scroll over the dashboard)

Part 2 — Admin Portal & AI Features (3:00–6:00)

Speaker: Azar

Screen: Switch to Admin login → Admin dashboard → Issue management

Teammate 2:

“Now I’ll walk you through the **admin side** of Civic Connect.”

(Screen: show login screen)

“Admins can securely log in using **passkeys**. We’ve designed two access levels:

- The **Super Admin**, who can view and switch between all departments, and
- **Department Admins**, who only manage issues in their specific department.”

(Screen: log in using Super Admin passkey)

“Once logged in, admins can see all reported issues. They can **filter, search, and update statuses** directly here.”

(Click through: show a few reports, update one status)

“Each issue also comes with a **Gemini-powered summary** that condenses long citizen descriptions into short, actionable insights.

This really helps department admins understand problems faster.”

(Screen: hover over AI summary section)

“We’ve also built a **notification system** — when an issue’s status changes or feedback is given, a simulated in-app notification pops up for both admins and citizens. It makes the whole process more interactive.”

(Pause while showing a notification alert)

“And all this ties back to the main goal — to make communication between citizens and city departments seamless, transparent, and efficient.”

Part 3 — Code, Tech Stack & Future Scope (6:00–9:00)

Speaker: Himanshu

Screen: VS Code → GitHub Repo → README → Deployment page

Teammate 3:

“Now let’s go a bit under the hood and look at how we built this.”

(Screen: show project structure in VS Code)

“Civic Connect is a **serverless web application** built with **React** and **TypeScript**, styled using **Tailwind CSS**.

The intelligence layer — like department suggestion, summaries, and the chatbot — all come from **Google Gemini API**.”

(Screen: show API integration section in code)

“For data, we wanted something fast and easy to demo during the hackathon, so we used the browser’s **localStorage** as our database.

This allows the app to simulate full backend functionality — storing users, issues, and notifications — all within the browser.”

(Show localStorage usage briefly in code or console)

“It’s a fully **client-side app**, meaning it’s quick to deploy and works great for hackathon environments. You can view the live deployment at civic-connect-862542138631.us-west1.run.app.”

(Pause briefly to let link sink in)

“We’ve also uploaded our full code on GitHub — public, clean, and well-documented.”

(Screen: show GitHub repo overview)

“For future development, we plan to migrate to a **Node.js + Express** backend, add a **PostgreSQL or Firestore database**, and use **Google Cloud Storage** for image uploads.

Real-time updates using WebSockets would make it production-ready for city-scale use.”

(Screen: scroll through the README “Future Scope” section)

Part 4 — Wrap-up (9:00–10:00)

All on camera (smiling, screen shows dashboard or banner)

Puranjay:

“In summary, Civic Connect bridges the gap between **citizens and city departments** with AI-powered communication and transparency.”

Azar:

“We built this with speed, creativity, and real-world impact in mind — showing how AI can simplify civic engagement.”

Himanshu:

“We’re proud of what we accomplished together as a team — blending design, AI, and community-driven innovation.”

All together (smile):

“Thank you for watching our demo of **Civic Connect!** 🚀”

(Screen fades out to banner or logo)

💡 Recording Tips

- 🎥 Keep all three cameras **on the same layout** in your meeting (e.g., side-by-side or top bar).
 - 💻 Screen sharer should zoom slightly when showing smaller details like code or dashboards.
 - ⏸ Take small pauses (1–2 seconds) after key points — it sounds confident and gives breathing room.
 - 🗣 Everyone should keep a clear, friendly tone — think *TED Talk + demo energy*.
-
