3 Problem Statement

Choose any one
Deadline - 26th October, 7 pm

1. Improve My City

Context:

Citizens often struggle to report or track issues like potholes, garbage, or streetlight failures in their local area. Complaints get lost, and there's no transparent system for updates.

Problem:

Build a web or mobile application that allows citizens to report, track, and view resolutions of civic issues in their neighborhood.

Requirements / Ideas:

- Users can log complaints with photos and location (using Google Maps API).
- Backend stores and tracks issue status (e.g., Pending, In Progress, Resolved).
- Admin/authority dashboard to view complaints and mark progress.
- Public dashboard showing resolved issues (for transparency).

Bonus:

- Add a chatbot (simple rule-based or API-based) for users to ask, "What's the status of my complaint?"
- Integrate push/email notifications on status updates.

2. Plan My Outings

Context:

Friends often struggle to coordinate movie nights, weekend trips, or group outings — figuring out when, where, and what to do becomes a nightmare of WhatsApp messages.

Problem:

Create a smart event planning web app that helps groups decide plans together with suggestions for movies, restaurants, and hangout spots based on preferences.

Requirements / Ideas:

- Group creation, polls, and RSVP features.
- Integrate free APIs (like Google Places, TMDb for movies).
- Smart suggestions: “Best-rated café near all members.”
- Chat-based or fun emoji reactions for voting.

Bonus:

- Add a “Mood-based recommendation” (e.g., chill, adventurous, foodie).
- Integrate a chatbot (like “PlanPal bot”) to coordinate plans.

3. MindTrack – Personal Wellness & Habit Tracker

Context:

Many people want to build better daily habits (exercise, journaling, meditation) but fail to stay consistent due to lack of reminders and motivation.

Problem:

Build a personalized wellness tracker app that helps users track habits, moods, and goals.

Requirements / Ideas:

- Simple dashboard for daily habit check-ins (e.g., water intake, reading, walking).
- Calendar view for streaks and progress.
- Backend stores and analyzes trends (e.g., average completion per week).
- Option for motivational messages, reminders, or streak rewards.

Bonus:

- Allow sharing progress with friends for social motivation.
- Add lightweight AI (optional API) to suggest “new habits to try” based on user history.
